Join
/scan/variant
Request checks: DNA only (U is refused as RNA) · /predict ≤ 64 sequences, each ≤ 5,000 nt · /scan/genome ≤ 20 kb
12 prediction heads
Biophysically anchored (7)
Tm, topology, transitional pH,
folding vs matched shuffles
Genomic proxies (3)
CUT&Tag peak association;
not a folding probability
Derived or predicted (2)
Labels from another model
or from the sequence itself
Applicability gate, per head
Supported estimate | extrapolation hidden | refused, no number
Provenance block on every response
model SHA-256 · matches_manifest (true / false / unknown)
build versus runtime environment
Release assets, verified before use
model · atlas_core · G4-seq scanner from GitHub release v0.5.1
SHA-256 checked against assets_manifest.json when the
image is built; a mismatch stops the build
Optional: AlphaGenome variant scores
AVI Tabix bundle · table export · live API
exact join on chromosome, position, ref, alt;
never by proximity
